JOS GLOBALLY

Commerce, Contributions & Legacy Recognition

Implementation Addendum to the Master Development Roadmap | Version 2.0 | 28 October 2026

Website: josglobally.com **Technology:** TypeScript, Next.js, SCSS, PostgreSQL, Supabase, Bun and PWA.

Purpose: Introduce two independent financial journeys - international product purchasing and voluntary contributions - while preserving transparent accounting, operational integrity, and the long-term ambition of economic growth for Jos Plateau.

Operating concept: Product sourcing and overseas partner coordination supported by CBrilliance in China; a growing network of partners supporting jobs, local presence, investment connections, trade and development in Plateau State. Such future activity is a vision, not a guaranteed outcome of an individual transaction.

PURCHASE / ORDER	DONATE / CONTRIBUTE
Commercial checkout for verified products, quotations and foreign partner orders.	Voluntary funding to support stated movement activities, with acknowledgements and an auditable legacy record.

IMPLEMENTATION PRINCIPLE

One platform, two independent transaction ledgers, separate checkout interfaces, separate legal notices, distinct refund rules and different reporting categories. Never portray either payment pathway as purchase of equity, shares, dividends, guaranteed returns or automatic legal ownership.

01 | What changes from the original roadmap

This document **supplements, not replaces**, the initial platform roadmap. Keep the brand system, global trade vision, profiles, CMS, security foundation, PWA functionality, analytics and admin capabilities. Update the contribution and stakeholder portions as specified here.

Original assumption	Revised design
Single contribution-to-partnership journey	Two primary transactions: product orders and voluntary donations
Payment amount determines benefit entitlement	Purchases earn commercial rights; donations earn acknowledgement/optional recognition, not financial returns
Contributor added automatically to stakeholder group	Separate labels for customer, supporter, strategic partner and formally appointed stakeholder
One receipt-verification queue	Distinct order payments and donation verification queues
One public contribution total	Separate commerce gross sales, verified contributions, refunds, costs and delivered impact

02 | User-facing navigation and information architecture

- Top navigation: Home, Shop Global, How Ordering Works, Contribute, Our Impact, Projects & Opportunities, About, Partners, Help, Account.
- Homepage CTAs: **Shop Global Products** and **Support the Movement**; each explains clearly what payment means.
- Shop Global subpages: category index, product list, product detail, quotation request, cart, checkout, order tracking, return/help.
- Support subpages: mission, fund allocation and disclosures, donation checkout, acknowledgement, optional legacy wall, transparent impact updates.
- My Account: Orders, Contributions, Recognition Preferences, Documents, Notifications and Support Requests.
- Responsive PWA: add-to-home-screen, offline shell for previously loaded informational pages; never claim offline financial submission is complete.

03 | Two checkout choices: screen-by-screen

A. Purchase journey

Discover product -> view specifications, seller/source, availability, expected timeline and estimated full landed price -> request quote if variable -> cart or accepted quotation -> contact and delivery details -> clear payment instructions and merchant terms -> pay -> upload proof or use gateway callback -> pending verification -> confirmed -> supplier sourcing -> inspection -> shipment -> customs -> domestic delivery -> completed / returns if needed.

B. Donation journey

Read mission and use-of-funds disclosure -> enter custom amount -> choose anonymous/public/private recognition -> contact details (guest donations supported where risk controls allow) -> optional dedication/message -> review clear non-investment notice -> pay -> submit reference/proof -> verified -> acknowledgement receipt -> personal history and optional legacy wall. Suggested amount buttons can include NGN 1,000 / 5,000 / 10,000 / Custom; no artificial urgency or pressure.

04 | Commerce: product catalogue and sourcing model

Launch categories: appliances, smartphones and computers, gadgets, accessories, machinery, industrial equipment, tools, devices, vehicles and vehicle accessories. High-value and regulated items should start as **request-for-quotation** rather than guaranteed instant purchases.

- Product model: SKU, title, category, specifications, voltage/plug requirements, condition, warranty, country of origin, seller/sourcing partner, images, options, stock/lead time, export and Nigeria import eligibility, HS code, inspection and certifications where applicable.
- Three listing types: fixed-price inventory; priced-to-order; quote-only procurement (particularly machinery and vehicles).
- No unverified claims of availability or delivery dates. Product prices must identify currency, FX validity window, and whether landed costs, duties, taxes and logistics are included.
- Admin workflow: vendor/sourcing partner onboarding, document verification, supplier quality checks, catalogue review and product suspension or recall.

05 | Transparent pricing and procurement

Customer-facing quotation must itemize supplier product price, handling/service margin, export handling, freight, insurance, customs duties and taxes, clearing, domestic transport and optional inspection fees. Where final amounts cannot be established, disclose assumptions and secure customer acceptance before charging any differential.

Recommended quote life-cycle: draft -> sent -> customer accepted -> payment pending -> verified -> procurement approved -> purchased -> in transit -> clearance -> delivery -> completed. Separate disputes, cancellation, refund and failed-delivery states. Record exchange rates used and the timestamp, source and party carrying FX risk.

For each order, identify the actual seller/merchant of record, importer of record, party responsible for warranty, and the contractual roles of Jos Globally and CBrilliance. The China operations entity and bank/collection entity must be verified before launch.

06 | Payments, receipts and verification

- Maintain distinct **order_payment** and **donation_payment** purposes under a generalized immutable transaction registry, with type, user, currency, gross/net amounts, method, beneficiary account, reference, timestamps and verification status.
- Manual bank transfer MVP: generate unique payment reference; display account holder and verified bank details; upload PDF/image evidence; accept bank transfer reference. Store proof privately, with signed access only.
- Do not confirm payments solely from screenshots. Reconcile with actual bank credits or trusted payment-provider events. Support bank statement imports with dual approval and audit trail.
- If gateway added later: server-side verification, signed webhooks, idempotency keys, amount/currency/reference checks, and replay protection.
- Pending / needs review / verified / rejected / reversed. Provide reasoned rejection and an appeal/help route; never let a frontend client set verified status.

07 | Donation philosophy and legacy recognition

A donation is a voluntary gift to support declared Jos Globally activities. It does not automatically grant product rights, shareholder status, repayment, investment return, business partnership or preferential access to publicly offered opportunities. Contributors may be respectfully called **Movement Supporters**; formal partner titles require a separate agreement and approval.

Recognition programme

- Private donor ledger: every verified donation, adjustments, refunds if applicable, attribution, date, campaign, purpose restriction and receipt number. Never erase history; reverse with compensating entries.
- Public **Legacy Wall** is opt-in only; display name/organisation, optional city, optional message and selected recognition type. Allow anonymous donation and easy withdrawal of public visibility.
- Suggested recognition labels avoid financial tiers: Founding Supporter, Community Supporter, Returning Supporter, Legacy Supporter. Avoid promising privileges proportionate to payments.
- Long-term remembrance: anniversary acknowledgements, founder stories, supporter milestones, printable recognition certificates clearly labelled *not evidence of equity or financial entitlement*.
- Allow a donor to choose general movement support or an approved restricted project; track restricted funds separately and describe handling if a project is cancelled.

08 | What the movement will publicly report

Use a transparent impact dashboard: confirmed donations received, refunds/adjustments, allocated and unallocated balances, approved programme spend, completed activities, partner-supported projects and supporting evidence. Commerce revenue is **not** donation revenue, and a customer purchase is not represented as a charitable gift.

Measure	Example reporting logic
Donations received	Sum of verified donation transactions minus reversals
Order value	Confirmed gross commercial order value (not unrestricted funds)
Funds applied	Approved and reconciled expenditure linked to programme/project
Impact result	Verifiable outcomes: businesses assisted, events, trade referrals, jobs supported where evidenced
Recognised supporters	Opt-in public count; do not reveal private donors

09 | User dashboards and the back office

Customer dashboard

Order cards with order ID, item, quotation, price breakdown, seller, source, delivery phase, estimated windows, payment documents, inspection/shipping evidence, downloadable invoice, dispute/return ticket and timeline.

Supporter dashboard

Total personally verified giving, donation timeline, certificates/acknowledgements, chosen supported initiatives, recognition settings, impact updates and data export. Prominently state that figures are historical gifts and are not redeemable balances.

Admin workspaces

- Procurement: products, suppliers, quotations, price approval, import documentation, shipment/returns, product moderation.
- Finance: separate order/donation inboxes, reconciliation, bank evidence, double approval for high-value cases, credits/refunds, immutable audit and reporting.
- Movement: campaigns, budgets, allocations, grants/project expenditures, recognition consent, story/impact review.

- Partner operations: CBrilliance China partner desk, supplier contracts, on-ground expansion milestones and formal partner agreements.
- Customer support: linked case IDs, communication history, SLAs, escalation rules and accessible complaint channels.

10 | Proposed relational database changes

Keep the first roadmap schema where useful. Add/enhance the following PostgreSQL tables. All monetary amounts should use integer minor units or NUMERIC with explicit currency and accounting policy; avoid floating point for money.

Entity	Core columns and obligations
catalog_products	id, sku, category_id, partner_id, listing_type, specs jsonb, origin, status, compliance_flags
product_variants / inventory	product_id, option attributes, stock/lead time, active quote validity
quotes / quote_lines	customer_id, items, landed-cost breakdown, rate, expires_at, accepted_at
orders / order_items	buyer_id, seller_id, source_partner_id, fulfilment status, accepted terms version
transactions	purpose (order/donation), amount, currency, reference unique, state, provider, verified_at
payment_evidence	transaction_id, private_storage_path, bank_reference, uploaded_by, reviewer_id
shipments / customs_docs	order_id, carrier, tracking, milestones, compliance documents
donations / donation_allocations	supporter_id, transaction_id, campaign_id, amount, restriction, allocation
recognition_preferences	user_id, consent, public_alias, message, visibility, consent_history
projects / expenditures	budget, objective, status, approvals, spend, published evidence
refunds / disputes / audit_logs	reason, actor, status, before/after metadata, signed event history

Database rules and indexes

- Use UUID primary keys, foreign keys, status constraints, unique payment references and unique gateway event IDs.
- Implement separate read models/views for donated sums, gross sales, recognized users and programme impact, using verified transactions only.
- Use append-only transaction/audit events and controlled compensating entries for financial reversals. Prevent hard deletion of audited accounting records.
- Supabase RLS: users access only their own orders/donations; staff roles scoped by function; partner staff access assigned orders only; finance writes only via protected server actions/service role.
- Use private storage buckets and time-limited signed URLs for payment proof, invoices and identity documents. Minimize collection and redact bank data in customer-facing views.

11 | Technical design: Next.js / Supabase / Bun / PWA

- Next.js App Router + TypeScript strict mode, Bun package manager and runtime where supported, SCSS modules/design tokens, Zod runtime validation, PostgreSQL on Supabase, Supabase Auth and Storage.

- Server-side business logic: create quote, verify order payment, approve procurement, create donation, accept bank proof, adjust funds, issue acknowledgment and write audit trail. Client components never decide monetary truth.
- Background tasks: use scheduled jobs/queues for supplier reminders, payment reconciliation, shipment tracking, invoice creation and notification dispatch. Retry with idempotency.
- PWA manifest, responsive layouts, installation prompts, appropriate icon sizes and service-worker caching for the non-sensitive public shell. No caching of bank statements, checkout secrets or private account content.
- Accessibility: semantic navigation, accessible form errors, reduced-motion support, keyboard testing and meaningful status announcements for transaction changes.
- Rate limits, anti-bot controls, optional step-up MFA for finance staff, anomaly alerts, security headers and periodic permission review.

12 | Suggested route map

Public: /, /shop, /shop/[slug], /categories/[slug], /how-orders-work, /contribute, /impact, /partners, /projects, /about, /help, /policies/returns, /policies/donations, /privacy, /terms.

Customer: /checkout/order, /checkout/donate, /account/orders, /account/orders/[id], /account/contributions, /account/recognition, /account/support.

Admin: /admin/commerce, /admin/quotes, /admin/orders, /admin/payments, /admin/donations, /admin/allocations, /admin/recognition, /admin/partners, /admin/compliance, /admin/reports, /admin/audit.

13 | Communications and sample checkout wording

Purchase acknowledgement

"Your order request has been received. Payment and product availability are subject to verification. Final procurement, import costs, fulfilment terms and estimated delivery will appear in your approved order or quotation."

Donation acknowledgement

"Thank you for supporting the Jos Globally movement. Your voluntary contribution will be recorded when payment is verified. It does not buy shares, ownership, dividends, refunds on demand or a guaranteed return. Public recognition is optional."

Movement messaging

"Every order can strengthen international trade connections. Every voluntary contribution can help sustain initiatives that promote a globally connected Jos Plateau. Together, we work toward lasting opportunities - and report transparently on what has actually been achieved."

14 | Regulatory and contract gates before launch

- **Consumer rights:** describe seller, fulfilment, faulty goods, cancellation, replacement, returns, complaint pathway and refund timing. Have Nigerian counsel review the Federal Competition and Consumer Protection Act and current rules/guidance.
- **Import rules:** determine HS classification, current tariffs, Form M, PAAR, licenses and SONCAP where applicable; verify each product class before listing. Vehicle, connected devices, electronics and machinery may have additional requirements.
- **Entity and contracts:** verify CBrilliance China corporate identity, suppliers, ownership of bank accounts, taxes, sourcing authority, responsibilities for damaged goods and the importer of record.
- **Donations:** verify the legal entity receiving donations, permissible purposes, appropriate taxation/accounting treatment, and whether any fundraising registrations apply. Do not represent donations as tax deductible without

professional confirmation.

- **Securities boundary:** if future offers promise profit share, equity, repayment or investment instruments, pause launch of that offer pending counsel/licensing review and applicable SEC requirements.
- **Privacy:** comply with the Nigeria Data Protection Act and applicable implementation guidance; document lawful basis, consent for public recognition, retention/deletion rules, international transfers and breach processes.
- **Payment risk:** AML/fraud risk reviews, confirmation of bank details, sanctions checks as appropriate, source-of-funds review for unusual high-value donations, and incident procedures.

15 | Delivery plan: migration after Version 1

Sprint	Build outputs	Acceptance gate
1 - foundations	Data migrations, transaction types, entitlement separation, roles	Old records remain intact; order/donation categories unambiguous
2 - commerce	Catalogue, quotes, cart, checkout, order timeline	Price breakdown, cancellation and supplier review tested
3 - giving	Donation flow, acknowledgment, privacy/legacy preferences	Anonymous and opt-in visibility fully tested
4 - finance	Separate reconciliation queues, audit, disputes, reports	Proof screenshots alone never verify bank credit
5 - operations	Shipping, customs, support, staff permissions, PWA	Signed docs, role boundaries, offline handling verified
6 - pilot	Controlled pilot, accessibility/security testing, analytics	Legal gates completed and launch issues resolved

16 | QA checklist and non-negotiable acceptance tests

- A donor paying NGN 1,000 enters the donation ledger only, never the commerce sales ledger; public identity stays hidden by default.
- A buyer placing an imported machine order sees the exact seller, quote expiry, applicable duty assumptions and the right to dispute.
- A payment screenshot with no corresponding bank credit cannot be marked paid automatically.
- The same transfer reference/webhook cannot credit two separate orders or donations.
- A reversed transaction reduces public totals through an audit entry rather than deleting historical evidence.
- A supplier sees only assigned items, not all supporter banking information.
- Unauthenticated and offline states never fabricate order confirmation or receipt verification.
- Staff cannot change a historical donation without a logged adjustment and authorized reviewer.

17 | Outcomes, KPIs and expansion

Commerce: quote acceptance, verified order GMV, on-time fulfilment, landed-cost variance, dispute rate, repeat orders, supplier quality and verified local jobs attributable to operations. **Contributions:** verified donations, active returning supporters, consented public recognition, allocation reporting time, programme outcomes and audit exceptions. **Institutional:** signed partnerships, supplier due diligence, China-Jos operational milestones and verified on-ground activity.

Later opportunities: B2B bulk buying, distributor portals, product escrow through appropriately regulated partners, trade finance via licensed providers, supplier APIs, multilingual support and field offices in Jos. These are extensions, not launch assumptions.

18 | Research and official reference checklist

These sources inform the compliance work; they are not substitutes for product-specific legal, accounting, customs or tax advice. Confirm current requirements at implementation time.
